

Go Backend Developer

Phone: +7 (920) 078-70-14

Telegram: @Rainz0r

Email: n52rus@gmail.com

GitHub: <https://github.com/Ra1nz0r>

TECHNOLOGY STACK

Go: net/http, concurrency, context, middleware, WebSocket, Fiber

API: REST/JSON, OpenAPI/Swagger, JWT, HTTPS/TLS, gRPC/protobuf

Databases: PostgreSQL (schema design, migrations, indexes, SQL), sqlc, SQLite

Infrastructure: Linux, systemd, Docker/Compose, GitLab CI/CD, cron

Observability: structured logging, debug/status endpoints, Sentry, Zabbix

Additional project experience: Kafka, Redis, Kubernetes, Microservices

Tools: Git, Bruno/Postman

ABOUT ME

Go backend developer with commercial experience in developing and maintaining production services. I work with backend services, integrations and PostgreSQL, taking tasks from implementation to deployment and post-release support.

EMPLOYMENT

1C-Rarus - Go Backend Developer

12.2024 – 03.2026

Integration backend services for mobile and internal systems. API, data exchange with 1C, WebSocket gateways, proxy services and production support.

- Developed backend services in Go for integrations with 1C, external APIs and internal business processes.
- Implemented APIs, background jobs and service logic, taking changes from development to production deployment.
- Worked with PostgreSQL. Designed schema changes, wrote migrations, added indexes, improved and optimized SQL queries.
- Developed integration scenarios between mobile applications, internal services and 1C, investigated data exchange errors and unstable behavior of external systems.
- Improved service diagnostics. Added structured logs, debug and status endpoints, Sentry integration and Zabbix monitoring.
- Configured and supported service deployment using GitLab CI/CD, systemd, env and TOML configuration.
- Implemented API security mechanisms. JWT, HTTPS/TLS, API key authorization, access control and protection of email-related scenarios from abuse.
- Wrote unit and integration tests, prepared API testing scenarios in Bruno and Postman.
- Investigated production incidents, fixed root causes and improved services after releases.

- Participated in requirements analysis, backend task decomposition and technical documentation for APIs, configuration and deployment.

Key projects:

1) PS 2.0 “MP Driver UAT”

- Designed and implemented a WebSocket gateway between 3 system components. Mobile application, backend server and 1C.
- Implemented a persistent WebSocket connection with 1C, command routing, error handling, reconnect logic and graceful connection shutdown.
- Added API key authorization, target database selection, user bindings and service commands for connection maintenance.
- Added 2 operational endpoints, status and debug, Zabbix metrics and Sentry integration.
- Configured deployment using GitLab CI/CD, systemd, TOML and env configuration.
- Prepared technical documentation and API testing scenarios in Bruno and Postman.

2) Internal backend service and integration platform for 1C-Rarus products

- Developed a backend service working in 2 modes. Data exchange with 1C and Web API for client and internal scenarios.
- Implemented APIs for account and access management, including password recovery and password change.
- Improved email-related scenarios and abuse protection. Limits, checks, JWT, HTTPS/TLS.
- Configured and supported deployment of 2 production services using GitLab CI/CD and systemd.
- Worked with PostgreSQL. Schemas, migrations, indexes, SQL queries and data maintenance.
- Maintained OpenAPI/Swagger documentation, including generation from 2 JSON sources.

3) UAT Proxy Server

- Took over development and support of an existing proxy service for integrations with external systems.
- Fixed request and data logging issues that affected reporting and consumption statistics.
- Implemented daily cleanup of 1,500,000+ records from the ext_host_log table in batches of 10,000 without stopping production traffic.
- Added 10+ new proxy directions, including role settings, external service settings and host configurations in the database.
- Supported service deployment, configuration and troubleshooting.

Project Experience in Go

03.2023 – 11.2024

- Developed educational and project-based backend services in Go, worked with REST and gRPC, PostgreSQL and SQLite, and used Docker to run services and databases locally.
- Practiced basic microservice scenarios, including service-to-service communication via APIs, Kafka, Redis and local deployment with Docker Compose.
- Gained basic Kubernetes experience with core resources and deployment of training services.
- Built and tested scenarios through CI/CD, wrote unit and integration tests, worked in Linux and automated tasks with Bash scripts.

ADDITIONAL EDUCATION

Yandex Practicum - Go Developer, SQL and Databases

Stepik - Go and Backend Development Courses

Hexlet - Go Development Course

EDUCATION

Nizhny Novgorod branch of the Academy of Labor and Social Relations

- Finance and Credit

LANGUAGES

- English – B1 / Intermediate
- Korean – A1
